Treatment of Malodorous Off-Gas & Air.

Waste Solutions has extensive experience in the application of soil bed and compost biofilters for treatment of contaminated air from primary industries, sewage treatment plants, sludge processing plants and farm installations (e.g. pig or hen rearing).

Waste Solutions has successfully designed air treatment biofilter installations for rendering plants, fish feed manufacturers and fish processing plants. The company has also successfully retrofitted pre-existing biofilter designs (by others) and achieved doubled design performance at marginal added costs.

The company offers a range of simple and low cost design options for small and large industries.
